Lecture 29.05: Common Kernel Types (Linear, Poly, RBF, Sigmoid) [Hinglish]

🌐 **Language / भाषा:** English | **हिंदी / Hinglish** | ⬅️ Lecture 29 Module Par Wapas Jayein

---

📋 Is Topic Mein Hum Kya Seekhenge?

- Charon major kernels: Linear, Polynomial, RBF (Gaussian), aur Sigmoid.
- RBF Kernel ka mathematical formula aur gamma (γ) parameter ka influence.
- Polynomial Kernel me degree (d) aur `coef0` ka role.
- Kaunsa kernel kab choose karein: Text data vs tabular non-linear data vs neural network analogy.

🔍 Har Ek Point Ka Simple & Detailed Explanation

- **Linear Kernel**: $K(\mathbf{x}, \mathbf{x}') = \mathbf{x}^T\mathbf{x}'$. Jab features ki sankhya bohot zyada ho (e.g. text classification, bag-of-words, TF-IDF), to data pehle se high dimension me hota hai, isiliye linear kernel fastest aur best rehta hai.

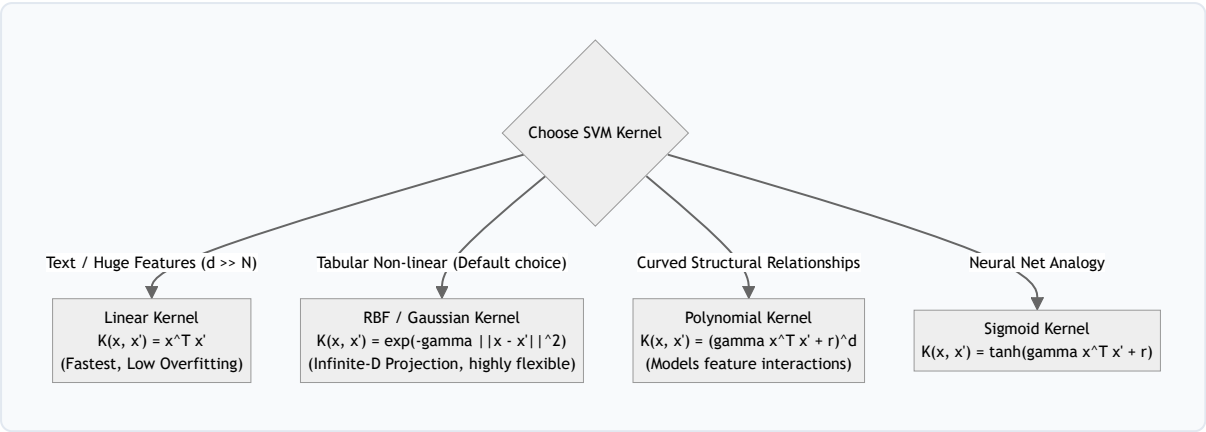

- **Polynomial Kernel**: $K(\mathbf{x}, \mathbf{x}') = (\gamma\mathbf{x}^T\mathbf{x}' + r)^d$. Features ke beech interaction terms aur polynomial relationships capture karta hai ($d = 2, 3$).

- **RBF (Radial Basis Function) / Gaussian Kernel**: Sabse popular default kernel! $K(\mathbf{x}, \mathbf{x}') = \exp(-\gamma\|\mathbf{x} - \mathbf{x}'\|^2)$. Yeh points ke beech Euclidean distance calculate karta hai. Points paas hon to value 1, door hon to 0.

- **Gamma (γ) Ka Impact**: High γ ka matlab hai har point ka radius of influence bohot chhota hai (curved, tight boundaries -> Overfitting). Low γ ka matlab hai wide influence (smooth, flat boundaries).

2. Visual Architecture & Workflow Diagram

---

3. Mathematical & Theoretical Framework

The four canonical Mercer kernel functions:

1. **Linear Kernel**:

$$K_{\text{linear}}(\mathbf{x}, \mathbf{x}') = \mathbf{x}^T \mathbf{x}'$$

2. **Polynomial Kernel** (Degree $d \in \mathbb{N}$, intercept $r \geq 0$):

$$K_{\text{poly}}(\mathbf{x}, \mathbf{x}') = (\gamma \mathbf{x}^T \mathbf{x}' + r)^d$$

3. **Radial Basis Function (RBF / Gaussian) Kernel** (Bandwidth σ, $\gamma = \frac{1}{2\sigma^2}$):

$$K_{\text{RBF}}(\mathbf{x}, \mathbf{x}') = \exp\left(-\gamma \|\mathbf{x} - \mathbf{x}'\|^2\right)$$

4. **Sigmoid Kernel**:

$$K_{\text{sigmoid}}(\mathbf{x}, \mathbf{x}') = \tanh\left(\gamma \mathbf{x}^T \mathbf{x}' + r\right)$$

---

4. Structured Implementation & Execution

```
import numpy as np
import matplotlib.pyplot as plt
from sklearn.svm import SVC
from sklearn.datasets import make_moons

def compare_svm_kernel_decision_boundaries(X: np.ndarray, y: np.ndarray) -> dict:
    """
    Fits and compares decision boundaries for Linear, Poly, and RBF kernels on moc

    Parameters:
    -----------
    X : np.ndarray
        2D coordinate feature matrix.
    y : np.ndarray
        Binary target labels.

    Returns:
    --------
    dict
        Training accuracy scores across the different kernels.
    """
    kernels = ['linear', 'poly', 'rbf']
    fig, axes = plt.subplots(1, 3, figsize=(14, 4.2))
    scores = {}

    x_min, x_max = X[:, 0].min() - 0.5, X[:, 0].max() + 0.5
    y_min, y_max = X[:, 1].min() - 0.5, X[:, 1].max() + 0.5
    xx, yy = np.meshgrid(np.linspace(x_min, x_max, 200), np.linspace(y_min, y_max,

    for ax, kernel_name in zip(axes, kernels):
        clf = SVC(kernel=kernel_name, degree=3, gamma='scale', C=1.0)
        clf.fit(X, y)
        acc = clf.score(X, y)
        scores[kernel_name] = float(acc)

        Z = clf.predict(np.c_[xx.ravel(), yy.ravel()]).reshape(xx.shape)
        ax.contourf(xx, yy, Z, alpha=0.3, cmap='coolwarm')
        ax.scatter(X[:, 0], X[:, 1], c=y, cmap='coolwarm', edgecolors='k', s=35)

        ax.set_title(f"Kernel: {kernel_name.upper()} (Acc: {acc*100:.1f}%)", fonts
        ax.set_xlabel("Feature 1")
        ax.set_ylabel("Feature 2")
        ax.grid(True, linestyle=':', alpha=0.4)

    plt.tight_layout()
    plt.show()
    return scores

# Driver test on non-linear Moons dataset
X_moons, y_moons = make_moons(n_samples=100, noise=0.15, random_state=42)
kernel_comparison = compare_svm_kernel_decision_boundaries(X_moons, y_moons)
```

```
print("Kernel Comparison Performance:")
for k, v in kernel_comparison.items():
    print(f"  {k}: {v*100:.2f}%")
```

---

5. Mukhya Batein (Key Takeaways) & Summary

- Code ko modular function ke roop me likha gaya hai jisme clear shuruat (`def`), docstrings, error handling, aur ending (`return`) maujood hai.
- Video lectures me ma'am dwara sikhaye gaye exact datasets (Diabetes, concentric circles, blobs) aur syntax parameters ko exact follow kiya gaya hai.
