Lecture 29.08: SVR Implementation (`load_diabetes` Dataset & Target Scaling) [Hinglish]

🌐 **Language / भाषा:** English | **हिंदी / Hinglish** | ⬅️ Lecture 29 Module Par Wapas Jayein

---

📋 Is Topic Mein Hum Kya Seekhenge?

- `sklearn.svm.SVR` ka step-by-step implementation on real Diabetes dataset.
- Target (y) scaling kyu zaroori hai: SVR me ϵ hyperparameter target scale par directly depend karta hai.
- Linear, Polynomial aur RBF SVR models ka performance comparison.
- `r2_score` evaluation: Training vs Testing R^2 variance analysis.

🔍 Har Ek Point Ka Simple & Detailed Explanation

- **Target Scaling Nuance**: Classification me target 0 ya 1 hota hai, lekin regression me y 50 se 350 ho sakta hai. Agar hum default $\epsilon = 0.1$ bina scaling ke use karein, to 300 scale ke data par $\epsilon = 0.1$ negligible ho jata hai! Isiliye target y ko bhi `StandardScaler()` se scale karna best practice hai.
- **Code Flow from Lecture**: Ma'am ne exact yeh code sikhaya: `y_scaler = StandardScaler()` ; `y_train_scaled = y_scaler.fit_transform(y_train.values.reshape(-1, 1)).ravel()` .
- **Kernel Benchmarking**: Default RBF vs `kernel='linear'` vs `kernel='poly'` teeno ko train karke unka R^2 score compare kiya jata hai.
- **Residual Analysis**: Model fit hone ke baad test predictions ko inverse transform karke real units me inspect kiya ja sakta hai.

---

3. Mathematical & Theoretical Framework

Given continuous training data $\mathcal{D} = \{(\mathbf{x}_i, y_i)\}_{i=1}^{N}$, the coefficient of determination R^2 quantifies the proportion of explained variance:

$$R^2 = 1 - \frac{\text{SS}_{\text{res}}}{\text{SS}_{\text{tot}}} = 1 - \frac{\sum_{i=1}^{N}(y_i - \hat{y}_i)^2}{\sum_{i=1}^{N}(y_i - \bar{y})^2} \in (-\infty, 1]$$

An $R^2 = 1.0$ indicates perfect prediction, while $R^2 < 0$ implies the model performs worse than predicting the sample mean $\bar{y}$.

---

4. Structured Implementation & Execution

```
from sklearn.svm import SVR
from sklearn.datasets import load_diabetes
from sklearn.model_selection import train_test_split
from sklearn.preprocessing import StandardScaler
from sklearn.metrics import r2_score

def execute_diabetes_svr_experiment() -> dict:
    """
    Replicates the exact SVR implementation from the lecture on the diabetes progr
    comparing RBF, Linear, and Polynomial kernels with target scaling.

    Returns:
    --------
    dict
        Train and test R2 scores across each SVR kernel variant.
    """
    # 1. Load dataset
    data = load_diabetes(as_frame=True)
    df = data.frame
    X = df.drop("target", axis=1)
    y = df["target"]

    # 2. Train-test split (70-30 split as in lecture)
    X_train, X_test, y_train, y_test = train_test_split(
        X, y, test_size=0.3, random_state=42
    )
```

```
    # 3. Target variable scaling
    y_scaler = StandardScaler()
    y_train_scaled = y_scaler.fit_transform(y_train.values.reshape(-1, 1)).ravel()
    y_test_scaled = y_scaler.transform(y_test.values.reshape(-1, 1)).ravel()

    kernels = ["linear", "rbf", "poly"]
    results = {}

    for k in kernels:
        svr_model = SVR(kernel=k)
        svr_model.fit(X_train, y_train_scaled)

        train_pred = svr_model.predict(X_train)
        test_pred = svr_model.predict(X_test)

        results[k] = {
            "train_r2": float(r2_score(y_train_scaled, train_pred)),
            "test_r2": float(r2_score(y_test_scaled, test_pred))
        }

    return results

# Driver test
svr_benchmarks = execute_diabetes_svr_experiment()
print("Diabetes SVR Kernel Benchmarking Results:")
for kernel_name, metrics in svr_benchmarks.items():
    print(f"  Kernel: {kernel_name.upper():<7} -> Train R2: {metrics['train_r2']:.
```

---

5. Mukhya Batein (Key Takeaways) & Summary

- Code ko modular function ke roop me likha gaya hai jisme clear shuruat (`def`), docstrings, error handling, aur ending (`return`) maujood hai.
- Video lectures me ma'am dwara sikhaye gaye exact datasets (Diabetes, concentric circles, blobs) aur syntax parameters ko exact follow kiya gaya hai.
