Submodule 35.05: Configuring Git (Identity & Settings)

1. First-Time Setup Requirements

Before creating commits, Git requires you to configure your **author identity**. Every commit you create is permanently stamped with your name and email address. This ensures full accountability and correct authorship attribution across collaborative teams.

---

2. Essential Configuration Commands

Set your identity globally across your entire system using the `--global` flag:

1. Setting Author Name:

```
git config --global user.name "Your Name"
```

Example:

```
git config --global user.name "Shivam Keshari"
```

2. Setting Author Email:

```
git config --global user.email "your.email@example.com"
```

Example:

```
git config --global user.email "shivamkeshari@gmail.com"
```

> [!IMPORTANT] The email configured in `user.email` should match the primary email address registered on your GitHub account. This ensures that GitHub correctly maps your local commits to your online profile and lights up your contribution heatmap.

---

3. Inspecting Git Configurations

To verify your configuration values at any time, execute:

```
# View all active configurations
git config --list

# Or query specific keys
git config user.name
git config user.email
```

Where Configurations are Stored:

- **Global**: Stored in `~/.gitconfig` (applies to all repositories for the current operating system user).
- **Local**: Stored in `.git/config` inside a specific repository (overrides global settings for that specific project).
