Submodule 35.07: Git Clone Command (Hinglish)

1. Cloning kya hoti hai?

Clone ka matlab hota hai duplicate ya exact copy banana. Jab hum GitHub par bani kisi remote repository ko apne local computer par download karte hain, toh use **Cloning** kehte hain.

Cloning sirf files download nahi karti, balki:

- Project ki saari files aur folders laati hai.
- Pura commit history aur branches download karti hai.
- Ek hidden `.git/` folder banati hai jisme pura version control system hota hai.
- Automatically `origin` naam ka remote pointer set kar deti hai jo GitHub repo ko point karta hai.

---

2. Command Syntax aur Upyog

```
git clone <repository_url>
```

Step-by-Step Workflow:

1. GitHub par project repository open karein.
2. Green color ke `<> Code` button par click karein.
3. **HTTPS** URL ko copy karein (jaise `https://github.com/delta-student/delta-demo.git`).
4. Terminal mein us folder mein jayein jahan project save karna hai.
5. Clone command run karein:

   ```
   git clone https://github.com/delta-student/delta-demo.git
   ```

6. Cloned folder ke andar enter karein:

   ```
   cd delta-demo
   ```

---

3. Clone hone ke baad verification

```
# Hidden files ke sath list karein
ls -la

# Check karein remote URL set hua ya nahi
git remote -v
```

Terminal Output:

```
origin  https://github.com/delta-student/delta-demo.git (fetch)
origin  https://github.com/delta-student/delta-demo.git (push)
```

Ab aapka local system cloud repository ke sath fully connected hai.
