Submodule 35.17: Git Pull Command (Hinglish)

1. Pulling ka Matlab

`git pull` command remote GitHub repository se naye commits download karke seedhe aapki local branch mein merge (integrate) kar deti hai.

---

2. Command Syntax

```
git pull origin main
```

Pull kab-kab chalana chahiye?

1. **Subah kaam shuru karte waqt**: Hamesha pehle `git pull` karein taaki team members ka likha naya code aapke paas aa jaye.
2. **GitHub par PR merge karne ke baad**: Cloud ka naya code local machine par laane ke liye.
3. **Do computer par kaam karte waqt**: Laptop se push kiya, PC par aakar pull kar liya.

---

3. `git fetch` aur `git pull` ka Difference

$$extgitpull = extgitfetch + extgitmerge$$

- **`git fetch`** : Sirf GitHub se data download karke memory mein rakhta hai, aapki chal rahi files ko bilkul touch nahi karta (100% safe).
- **`git pull`** : Download bhi karta hai aur sath hi sath aapke local folder ke files ko update (merge) bhi kar deta hai.
