Submodule 35.19: Galtiyan Sudharna (Reset, Revert, Undo) (Hinglish)

1. Git mein Galtiyan Theek Karna

Kaam karte waqt galtiyan hona aam baat hai. Git mein har level par galti undo karne ka tareeqa hota hai:

---

2. Add aur Modify ko Undo Karna

1. File ko Unstage Karna (Add Cancel Karna):

Agar galti se `git add secret.txt` kar diya:

```
git restore --staged secret.txt
# Ya purana tarika:
git reset HEAD secret.txt
```

File ka content delete nahi hoga, sirf green staging area se nikal kar wapas red normal state mein aa jayegi.

2. Apne Local Changes Discard Karna:

Agar aapne kisi file mein kuch galat likh diya aur aap chahte ho ki pichle commit jaisa ban jaye:

```
git restore app.js
```

---

3. Commit ko Theek Karna

1. Pichle Commit ka Message Badlna (`--amend`):

```
git commit --amend -m "Naya sahi commit message"
```

2. `git revert` vs `git reset`

- `git revert <commit_hash>` :
  - Yeh puraane galat commit ko delete nahi karta, balki ek naya commit banata hai jo us pichli galti ko cancel karta hai.
  - Team aur GitHub ke liye **100% safe** hai.
- `git reset HEAD~1` :
  - Yeh pichle commit ko history se gayab kar deta hai.
  - `--soft` : Commit gayab hoga par code staging area mein bacha rahega.
  - `--hard` : Commit aur code dono permanently gayab ho jayenge (dhyan se use karein).
