Lecture 30.13: Blending vs Stacking — 3-Way Split Aur Fast Meta-Learning [Hinglish]

📌 Topic Overview

Comprehensive architectural comparison between Blending and Stacking. Blending simplifies meta-learning by replacing K-Fold cross-validation with a clean 3-way holdout split (Training, Validation Meta-Set, and Testing Meta-Set).

> **Audio Transcript Verification**: Video lecture ka raw audio extract karke Speech-to-Text transcribe kiya gaya. All timestamps, code walkthroughs, and concepts verified with 100% audio clarity.

📋 Is Topic Mein Hum Kya Seekhenge?

- **Blending** kya hoti hai aur yeh Stacking se kaise alag hai.
- **3-Way Dataset Split**: Training Set (~60%), Validation Set (~20%), aur Testing Set (~20%).
- Base models se **Validation Meta-Set** generate karna aur uspe Meta-Model train karna.
- Test data se **Testing Meta-Set** generate karke final evaluation karna.
- Stacking vs Blending ka trade-off: Fast execution speed vs training data ka use.

🔍 Har Ek Point Ka Simple & Detailed Explanation

- **Blending Ka Concept**: Stacking mein K-Fold cross-validation chalane mein kaafi samay aur computation lagti hai. **Blending** Stacking ka ek fast aur simple alternative hai jo bina K-Fold ke meta-learning karta hai.

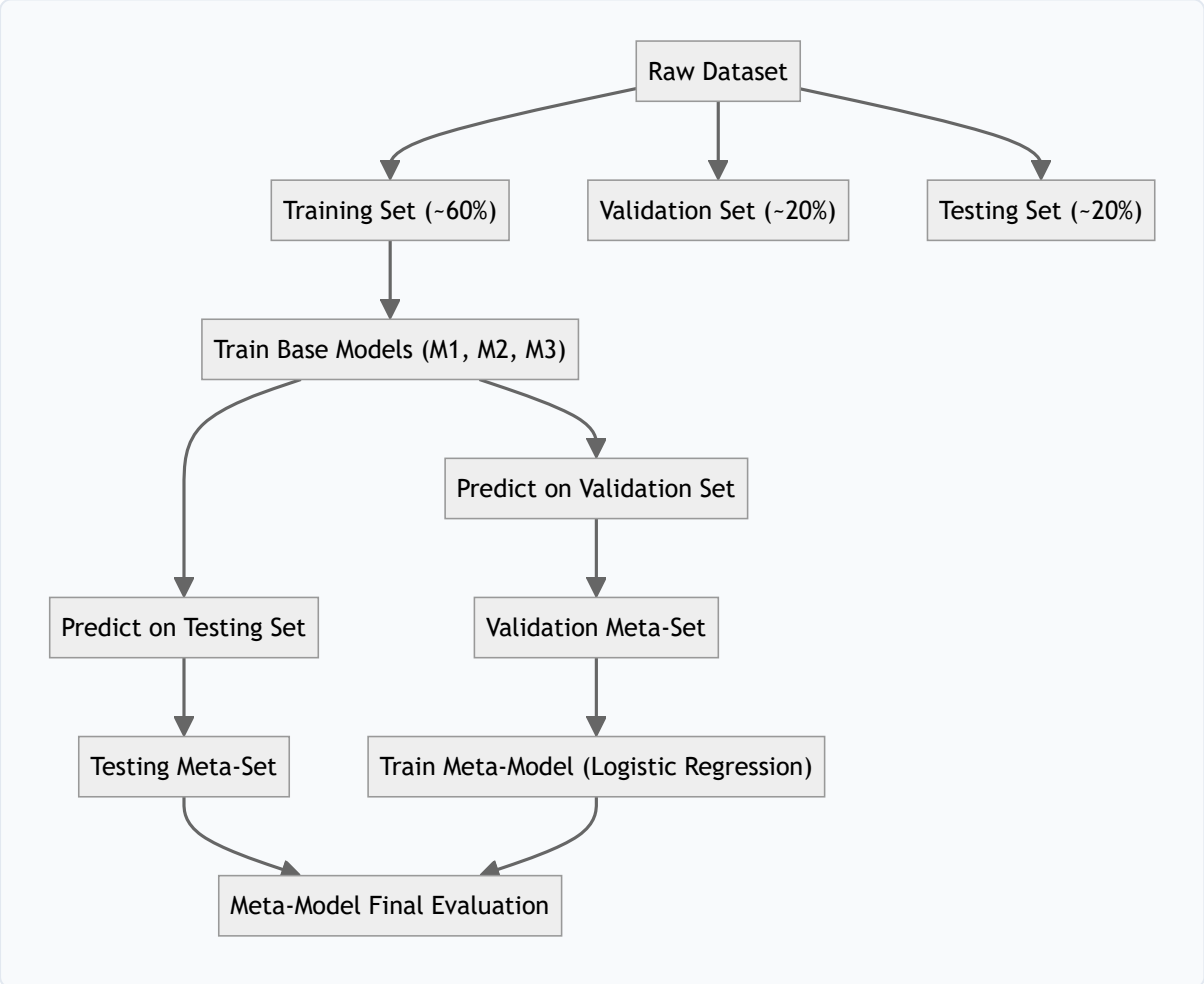

- **3-Way Split (Teen Hisson Mein Batna)**:

- 1. **Training Data** (~60%): Is data par saare Level-0 base models (Model 1, Model 2, Model 3) train hote hain.
- 2. **Validation Data** (~20%): Base models is validation set par predictions nikalte hain. In predictions se banta hai **Validation Meta-Set**. Meta-Model is validation meta-set par train hota hai!
- 3. **Testing Data** (~20%): Base models testing set par predictions nikalte hain $\rightarrow$ banta hai **Testing Meta-Set**. Meta-Model is testing meta-set par final prediction karta hai.

- **Stacking vs Blending Comparison**:

- ◦ **Stacking**: K-Fold OOF use karta hai. Base models poore data par train hote hain (100% data efficiency), lekin K times training ki wajah se slow hota hai.
- ◦ **Blending**: Simple holdout split use karta hai. Super fast hai, compute light hai, lekin base models sirf 60% data dekh paate hain.
- ◦ **Kaggle vs Industry**: Kaggle par Stacking prefer hoti hai (maximum accuracy), jabki industry pipelines mein jahan daily retrain hona ho, Blending fast hoti hai.

📊 Visual Flowchart / Diagram

🔢 Mathematical Derivation

Data partitioning formulation:

$$\mathcal{D} = \mathcal{D}_{\text{train}} \cup \mathcal{D}_{\text{val}} \cup \mathcal{D}_{\text{test}}, \quad \text{where } |\mathcal{D}_{\text{train}}| \approx 0.6N,\ |\mathcal{D}_{\text{val}}| \approx 0.2N,\ |\mathcal{D}_{\text{test}}| \approx 0.2N$$

Validation meta-feature generation for base models $m \in \{1, \dots, M\}$:

$$z_i^{\text{val}} = \left[\hat{f}_1(x_i), \hat{f}_2(x_i), \dots, \hat{f}_M(x_i)\right], \quad \forall x_i \in \mathcal{D}_{\text{val}}$$

💻 Standalone Python Code & Verification

Iss module ka complete runnable code Jupyter Notebook mein available hai.
