Lecture 27.10: Productionizing Credit Risk Systems & Resume Pointers

📌 Topic Overview

In this concluding lecture, Shraddha ma'am discusses **productionizing machine learning models**, how to present this minor project on your **Resume and GitHub**, and how to talk about trade-offs in technical interviews.

💼 How to Present This on Your Resume

Ma'am advises:

1. **Descriptive 2–3 Word Title**: Use an industry-sounding name like **CreditWise — Automated Loan Approval System** or **Loanify**.
2. **Business Impact First**: State that you reduced loan decision turnaround time from 7 days to real time.
3. **Highlight Precision**: Explain *why* you chose Naive Bayes over raw Accuracy (to minimize unrecoverable default loss).

💻 Python Implementation

```
def generate_resume_project_bullets():
    """
    Returns high-impact, professional resume bullet points for the CreditWise Minc
    as recommended by Shraddha ma'am in the final lecture.
    """
    resume_data = {
        'project_title': "CreditWise - Automated Loan Underwriting System",
        'bullets': [
            "Engineered an end-to-end automated loan underwriting pipeline on 1,00
            "Benchmarked Logistic Regression, KNN, and Gaussian Naive Bayes, optim
            "Implemented domain-specific feature engineering (DTI^2, CreditScore^2
            "Deployed model evaluation framework cutting loan turnaround time from
        ]
    }
    return resume_data

# --- Function Call & Testing ---
```

```
info = generate_resume_project_bullets()
print("Project Title:", info['project_title'])
print()
print("Resume Bullet Points:")
for b in info['bullets']:
    print(f" * {b}")
```

🔑 Key Takeaways

1. Recruiters care about business problem solving, not just `.fit()` and `.predict()`.
2. Always justify your choice of evaluation metric based on domain cost asymmetry.
